

Simulation-Driven Design for Additive Manufacturing with CAESES and Simcenter

CAESES User Conference 2022

Michael Hajduk

Table of contents

Index / Agenda

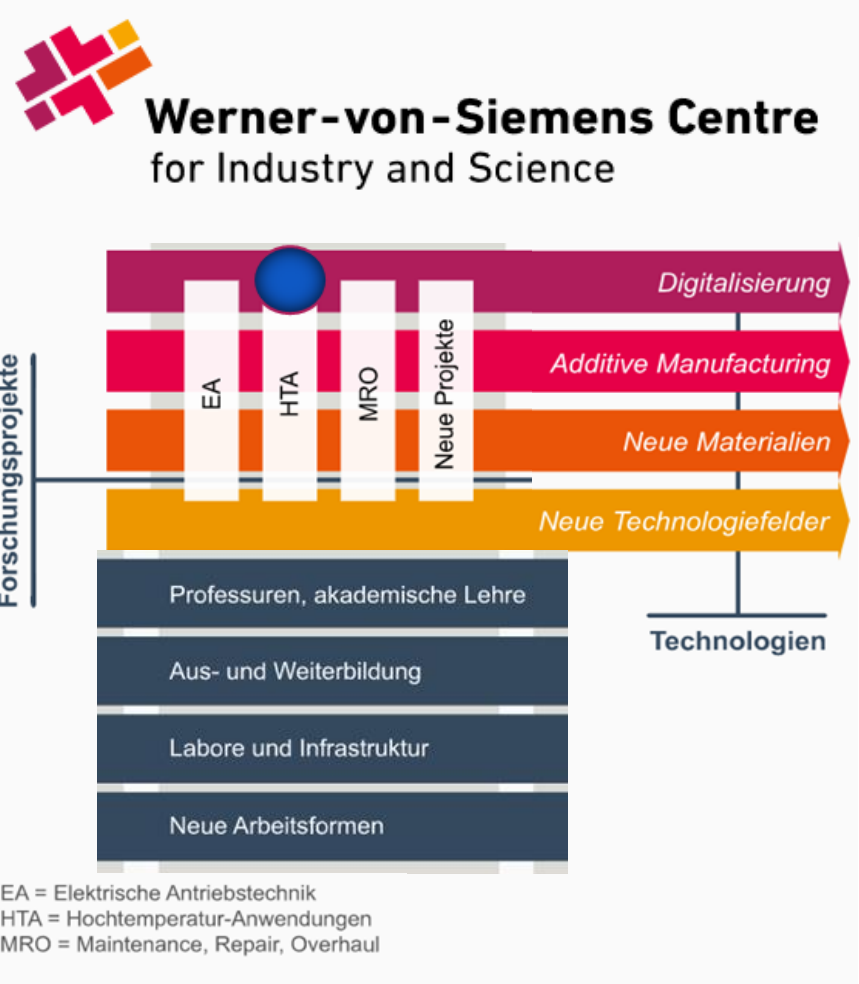

• Introduction	3
• WvSC and the HTA program	4
• L-PBF process simulation	6
• Simcenter AM process simulation	8
• Compensation with CAESES	9
• AM-specific cooling structure design	10
• Pilot cone use-case	11
• Cooling structure designs	12

Introduction

- M.Sc. Naval Architecture and Ocean Engineering at TU Berlin
- **2018 – 2021**
Research engineer in Design for Additive Manufacturing at Siemens Energy
- WP-Lead HTA.AM-3 (AM-specific design optimization)
- **Since 2022**
Technical Product Manager for
Simcenter Additive Manufacturing Simulation at
Siemens Digital Industries Software

WvSC and the HTA program

ca. 13Mio.€
total budget

AM-specific design optimization (HTA.AM-3)

Overview

L-PBF process simulation on a macro-scale

L-PBF process simulation

Introduction

Problem

- The powder bed fusion process induces thermal shrinkage and hence thermo-mechanical stress in each printed layer
- That stress can cause the part to distort during the printing process
- Large distortions may lead to a fatal recoater crash or to a final part geometry that is out of part specification

Solution

- With Simcenter for PBF we simulate these distortions and allow users to either change build job design or to change part geometry by compensating the distortion

Recoater
Collision

Support
Failure

Shrinklines

Overheating

L-PBF process simulation

Simcenter PBF and Advanced PBF Solution

Simcenter PBF

- Voxel-based mesh
- Purely mechanical solution
- Easy to use for non-CAE engineers

Simcenter Advanced PBF

- Tetrahedral mesh based
- Thermal + Mechanical simulation
- Full Simcenter Pre/Post functionality for CAE engineers

L-PBF process simulation

Compensation with CAESES and Simcenter

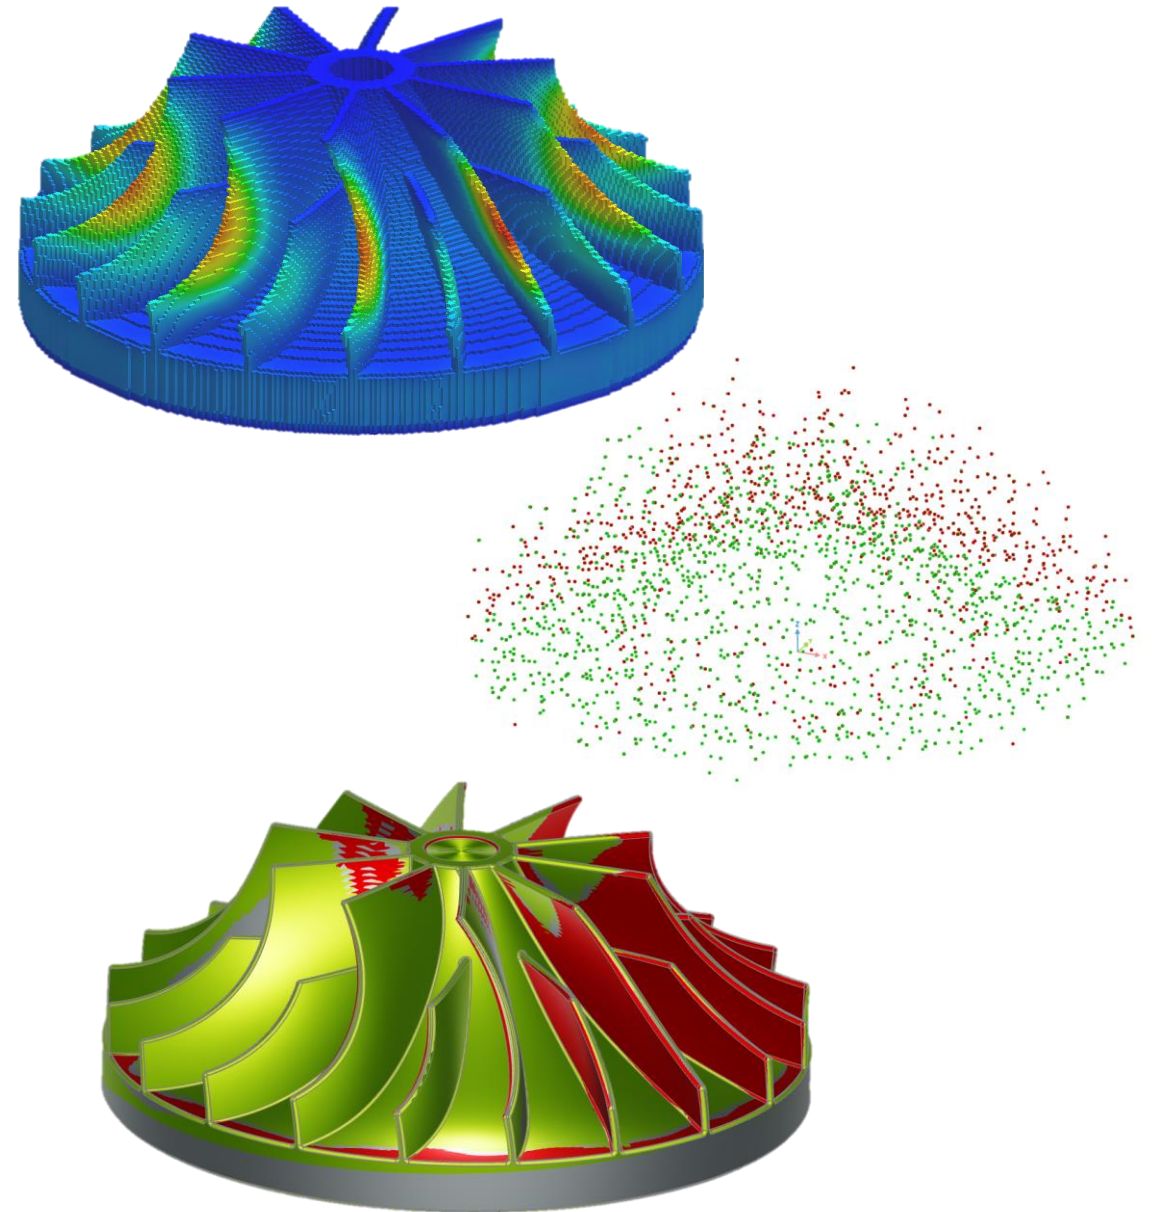

Problem

Both, solutions generate distortion and compensation results based on the FE model (voxel- or tet-mesh). These models are very rough and can not directly be printed in that state.

Solution

The distortion and/or compensation results can be extracted and used in CAESES to morph the original B-Rep solid model to fit the compensation results of the simulation. The resulting solid model then can be sent to the PBF printer.

Integration into Simcenter PBF planned for Q2 2023

AM-specific cooling structure designs for high temperature applications (HTA.AM-3)

AM-specific design optimization (HTA.AM-3)

Pilot Cone Use Case

AM-specific design optimization (HTA.AM-3)

Gyroid structured wall

Baseline (~0Q9) – Base Concept

Gyroid Structure Conzept (~1c3)

AM-specific design optimization (HTA.AM-3)

Surface augmentation for cooling and hybrid coating

AM-specific design optimization (HTA.AM-3)
Effusion cooling via Designed Materials

AM-specific design optimization (HTA.AM-3)

Adaptive channel cross-section

Standard round channel

Adaptive channel cross-section

→ Fully parametric channel geometry optimization through CAESES

AM-specific design optimization (HTA.AM-3)

Manufacturability tests

Thanks! Questions?

Are you a student in engineering and interested in [#simulation](#) and [#additivemanufacturing](#)? Then you should come join us!
Our product management team is looking for a student to support us in developing our Simcenter Additive Manufacturing simulation tools!
